# Continuing construction of transmission projects in your area

In 2016, our construction crews completed multiple projects to improve reliability and reduce the risk of outages to customers in your area. These projects included building a new 25 MVA substation at Craw and Coles Roads and undergrounding a section of distribution line outside the new substation.

To complete the series of projects, we began upgrading the Langley 15 feeder extension, an existing single-phase low-voltage line, to a higher capacity three-phase line along Maxwellton Road south from Craw Road and extending onto French Road. This will provide additional capacity to allow the new substation to back up electric load normally served by Langley substation, and will greatly improve reliability of electrical service in Langley.

After the Langley 15 feeder is upgraded and operational, we will then replace the aging wooden poles of the Langley Tap, an existing transmission line currently

running from the Langley substation, along SR-525, Midvale Road, Maxwellton Road and Craw Road to the new Maxwellton substation. (See map)

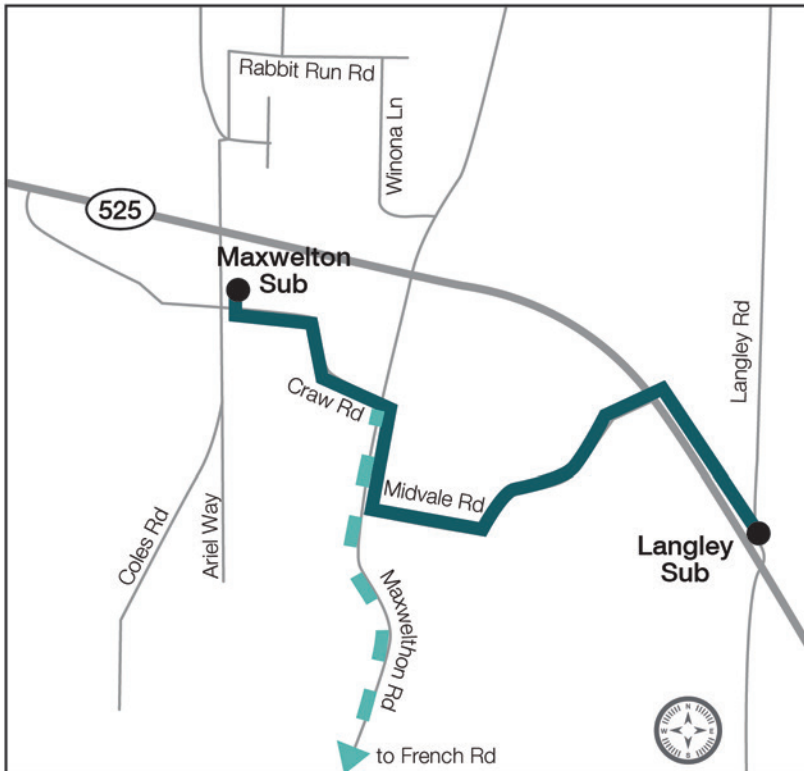

Prior to construction, our vegetation management partner, Asplundh, will trim and remove vegetation as needed for safe construction.

We anticipate construction along the Langley Tap to begin in the fall 2018.

We appreciate your patience throughout this process. We do our best to limit impacts to our customers and keep you informed about construction.
